

SPACE EXPLORATION

SAMPLE ESSAY 1 *“Space exploration is much too expensive and the money should be spent on more important things.” Do you agree or disagree?*

From past to the present, there have been huge improvements in space exploration. There are a lot of organizations like NASA, JAXA, Aerospace Industries etc. engaged in activities related to space. Yet, space research is quite costly; it takes millions of dollars to launch even a simple object into space. That is why, there is an argument that exploring space is a waste of money and that there are more urgent needs to be addressed on earth, such as reducing poverty and preventing climate change and environmental destruction. However, I completely disagree with this

opinion for two reasons which are it leads to technological improvements and it is a requirement for the information age that we all live in.

The first significant reason why space exploration is necessary is that many technologies originated thanks to space research. **To start with**, take satellite technology, for example, which people depend on for broadcasting and weather forecasting. Without satellites, people would not be able to follow global events as they happen, nor would the populations be given any warning of approaching storms. **Furthermore**, space research has led to the development of new lightweight materials that offer heat protection and enable food preservation. Therefore, the challenge of sending human beings into space has often driven the development of new technologies that benefit the everyday lives of the individuals. **In short**, space research is not only beneficial in terms of scientific developments, but every day needs as well.

Another important reason for space research is the pursuit of knowledge. **Firstly**, it is almost impossible to foresee the distant future, so human beings ought to develop the capability to escape from the earth. There is accumulating data on how humans can survive for long periods in space and even travel to other planets in the future. If space exploration is halted, this valuable knowledge will never be acquired. **Moreover**, it is true that environmental destruction is a serious issue, but it is also true that people remain dependent on their environment if they never accept the challenge of exploring other worlds. **To sum up**, thanks to space exploration, the possibility of existence on other planets may become a reality.

In conclusion, while there are undoubtedly serious problems on our own planet, **I strongly believe that** it is imperative that we continue to explore space. This will promote further technological advances as well as providing a possible means of escape should earth become uninhabitable in the future. Ideally, all nations should cooperate in the advancement of space research.
